

Roots Bend Toward Live Mana at the Rail Exchange

The cordon held and the severed hands were left undisturbed, but roots are bending toward active mana conduits as failed grain pumps remain downstream.

BY OSSAN REED

Boundary Rail Exchange — BOUNDARY RAIL EXCHANGE — Roots at the breached exchange are bending toward active mana conduits, according to Orin Pell’s new account, turning an already gruesome isolation site into an energized hazard. The cordon and warning procedure remained intact, and the severed hands of the missing elven scientific delegation were not disturbed. That is the narrow good news. The larger fact is that roots are bending toward active conduits at the breach.

Hours earlier, Vesa Thorn publicly instructed workers to hold the isolated section, maintain measured drawdown, avoid energized channels and the severed hands, widen the safe cordon, report changes in roots and conduits, and mark a withdrawal route. The precautions read like an inventory of ways to die. They may keep a worker from stepping into the current or trampling what the breach delivered, but they do not answer what, if anything, must now be shut down.

The danger began as policy with tools attached. The Greathold reversed a deep mana current to feed a new lift-and-pump line; three nights later came the speaking child from an elven seed-vault, and at dawn roots broke into the rail exchange bearing severed hands, each palm burned with a different court seal. Downstream grain pumps failed while courts and communes disputed jurisdiction. Now roots are bending toward active mana conduits, workers were publicly instructed to hold the isolated section, and downstream grain pumps have failed. The question is what must be isolated, what can be safely fed, and whose body will be placed nearest the answer.

GUILDS & TRADE

Households Put the Greathold’s Counterflow on the Record

A dated calibrated counterflow report and hearing petition give Gaugewatch Households a public record as failed pumps and dangerous works sharpen the wider dispute over the Greathold’s current.

BY CORIN VEY

Gaugewatch Gallery — Gaugewatch Households have created and retained a dated, calibrated counterflow report and hearing petition, hauling counterflow out of the fog of grand infrastructure and into the harsher arithmetic of gauges, shutdowns, demands and replies. The report rail now publishes those readings and exchanges. Alongside them remains a question the record has not settled: who has been receiving the current diverted into the new lift-and-pump line, and whether the petition can compel a shutdown or redistribution.

The petition was recorded three days after the Canopy Wire reported the Greathold’s deep-current reversal. The Wire reported that downstream grain pumps failed. It also reported that roots breached a Greathold rail exchange and delivered the severed hands of a missing elven scientific delegation, each palm burned with a different court seal. A border legion refused orders, river communes seized toll bridges, and no authority could agree which court, commune, bloodline, treaty or living landscape had jurisdiction. The record contains failed pumps, contested crossings and severed hands.

That is the households’ gain: not safety yet, nor restored grain pumping, but possession of a dated instrument against the usual politics of delay. Markets reveal alliances that proclamations conceal, and any accounting of current may do the same. If the hearing petition compels disclosure, shutdown or redistribution, it may show whose lifts were treated as indispensable. If it does not, the Greathold will have answered calibrated readings with the oldest toll in public works: an official record without an official reckoning.

REALM AFFAIRS

Sinkroot Wins a Look at the Current — Now Comes the Fight Over Who Is Fed

A settlement has put measured deep-current turbulence and a proposed interim feeding arrangement under immediate public scrutiny. The unanswered question is who will be fed and who may bear the risk.

BY MERA QUILL

Sinkroot Gauge Gallery — A dispute involving Sinkroot Residential Roll has been settled with immediate public scrutiny of measured deep-current turbulence and a proposed interim feeding arrangement. That settlement strips the Greathold’s deep-current reversal of its last useful disguise as a mere lift-and-pump project: while the current is under scrutiny, every proposed necessity carries an allocation question. Who gets the feed, who goes without, and whose walls, roots or bodies are made to absorb the risk are now matters for public contest.

The settlement comes amid a crisis that acquired grotesque evidence of its own. The Greathold reversed a deep mana current to supply a new lift-and-pump line; three nights later, a seed-vault produced a speaking child bearing the memories of six rival bloodlines and accusing an unnamed regent of murdering a river. At dawn, roots breached a Greathold rail exchange and delivered the severed hands of a missing scientific delegation, each palm burned with a different court seal. Whatever the courts eventually call these events, the public is entitled to notice what official language prefers to separate: a reversed current, a living breach and ruined flesh.

Downstream, the grain pumps failed. A border legion refused orders, river communes seized toll bridges, and jurisdiction dissolved into quarrels among courts, communes, bloodlines, treaties and the living landscape itself. Against that spectacle, the Sinkroot settlement is modest but sharp-edged. It records immediate public scrutiny of turbulence and a proposed interim feed. It does not steady the current or restore a pump.

That naming is what comes next. An interim feed may move necessities and risk in ways the present record does not settle. Public scrutiny is not safety; procedure is often only the name authority gives to somebody else’s pain. But after roots breached the rail exchange, grain pumping failed and severed hands of a missing delegation were delivered there, the argument can no longer hide in a technical memorandum: anyone proposing to move this current should say in public whom it will feed, whom it will expose and why those residents should be asked to pay again.
